How would you measure Brand Equity?

**Any thoughts about what you might do
if you were Shell?**

A Beginning of a Solution:

What do you hate about gas stations?

Takeaway #1

Physical Attributes \neq Product

Physical Attributes \neq Product

Takeaway # 2

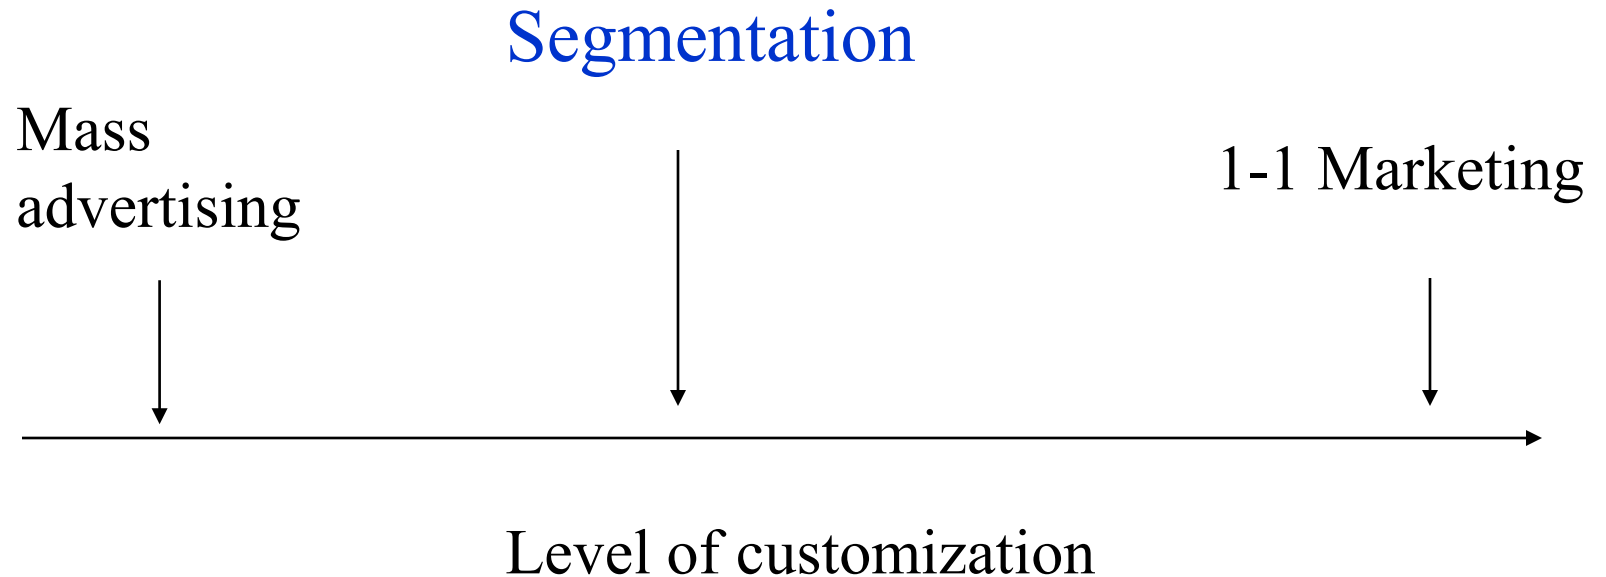

Celebrate Heterogeneity

Takeaway #3

40% of 30% > 10.7% of 100%

The idea behind segmentation

**So, how are they going to implement a
segmentation scheme?**

Shell starts collecting data!!

Shell's Customer Segmentation Study Methodology

- Surveyed 5000 respondents in 6 markets
- Questions included
 - Behavior Patterns
 - Desired Features
 - Frustrations
 - Brand Ratings
 - Psychographics
 - Demographics

- Statistically identified 10 distinct “clusters” of customers with different needs/attitudes (based on needs)

- Studied survey results from each cluster
- Developed name & personality for each cluster

- Conducted in-depth interviews and focus groups to understand key issues.

- Understand perceptions of clusters

Illustration in two dimensions: Select bases that maximizes this ratio

$$\max_{\forall \text{ possible configurations}} \left\{ \frac{\text{between group variance}}{\text{within group variance}} \right\}$$

Determining the number of clusters (elbow plot)

Basic idea behind clustering

Group Assignment

Basis variables

F	\$37K	R
M	\$41K	U
F	\$29K	U
F	\$17K	R
F	\$20K	R

Using Discriminant Analysis/Classifiers with Cluster Analysis Output

Group Assignment

- Challenge is that you don't have the basis variables for people not in the sample: so what can you do?
- Treat the group assignment as an outcome (Y) and use a classifier, e.g. discriminant analysis to predict the group assignment based on observables (e.g. the profiling variables which are easy to get)
- In the jargon of the industry, this is called a "typing tool"

Profiling Variables

So which segment(s) should Shell go after??

How to Select Segments to Target

Market Attraction

- Segment size
- Amount and strength of growth
- “Value” of segment
- Synergies between segments

Company Fit

- Current position in segment
- Ease of entry into segment

Competitive Environment

- Number and strength of competitors
- Ease of competitive entry into segment

Shell's Plan

- Sought to choose an identity (group of segments) that was:
 - Unique in the market
 - Not easily copied, and
 - Attractive based on based on margins, volume, and Shell's capabilities to meet those segments
 - ex: Leave low price to independents

Quick and Easy Shell

Premium Speedsters

Safety Firsters

Simplicity Seekers

So, what innovations would you try?

- **Vending at pumps**
- **Unmanned stations**
- **Cash accepted at pump**
- **Bar code payment**
- **Frequent filler plans**
- **Drive through “mini-marts”**
- **Additional convenience store products/services**
- **Robotic gas pump**
- **Remote (workplace) delivery**

The problem: How can Shell anticipate how customers and competitors will respond to a product innovation before the start of the PLC?

Standard Approaches: Survey Ask People What They Would do

- **They don't know**
- **Can't tell us with any precision**
- **They don't want to say**
- **Don't have explicitly formed preferences**

Standard Methods (Cont'd)

- **Laboratory Simulation**
 - **external validity**
- **Test-market/beta testing**
 - **requires full product development**
 - **tips competition**
 - **external validity**

The conjoint world

- Attributes
- Attribute levels
- Part-worths
- Attribute importance
- Utility

Attributes

- Conjoint analysis represents products or services as bundles of attributes
- An attribute may be any clearly defined feature or characteristic
- Examples
 - price
 - brand
 - size
 - performance

Attribute selection

- Attributes in conjoint should be
 - clear and unambiguous
 - determining choice
 - actionable
- The total number of attributes should be kept low
 - 6 is the average
 - most studies fall between 4 and 8
- Use qualitative research and pretests to decide on attributes and levels

Comments About Conjoint

- More attributes and levels = more pairs/tasks
- Adaptive Conjoint -> Choose 50-50 pairs
- Has been applied in many settings (Courtyard by Marriott, EZ Pass, Car Design, etc..)
- Can be used as a basis for segmentation
- Bayesian conjoint – individual-level partworths with data sharing
- Monotone constraints
- Key is out-of-sample prediction/validation

A Solution: Conjoint Analysis Simulator

- Conjoint Analysis used to build a model of how consumers will respond to different identities and different sets of new station attributes;
- Shell executives participated in a war-gaming exercise in which they role-played the major competitors, each making similar identity and station-attribute decisions.

Shell Strategy Simulator.xls

What happened...

- Launched the most expensive supporting advertising campaign in the history of gasoline retailing (\$30 mm budget, George Lucas directs)

But then...

- Mobil observes Shell's ads, and says, "quick n' easy...what a great idea!"
- Beat them to the market with Speedpass

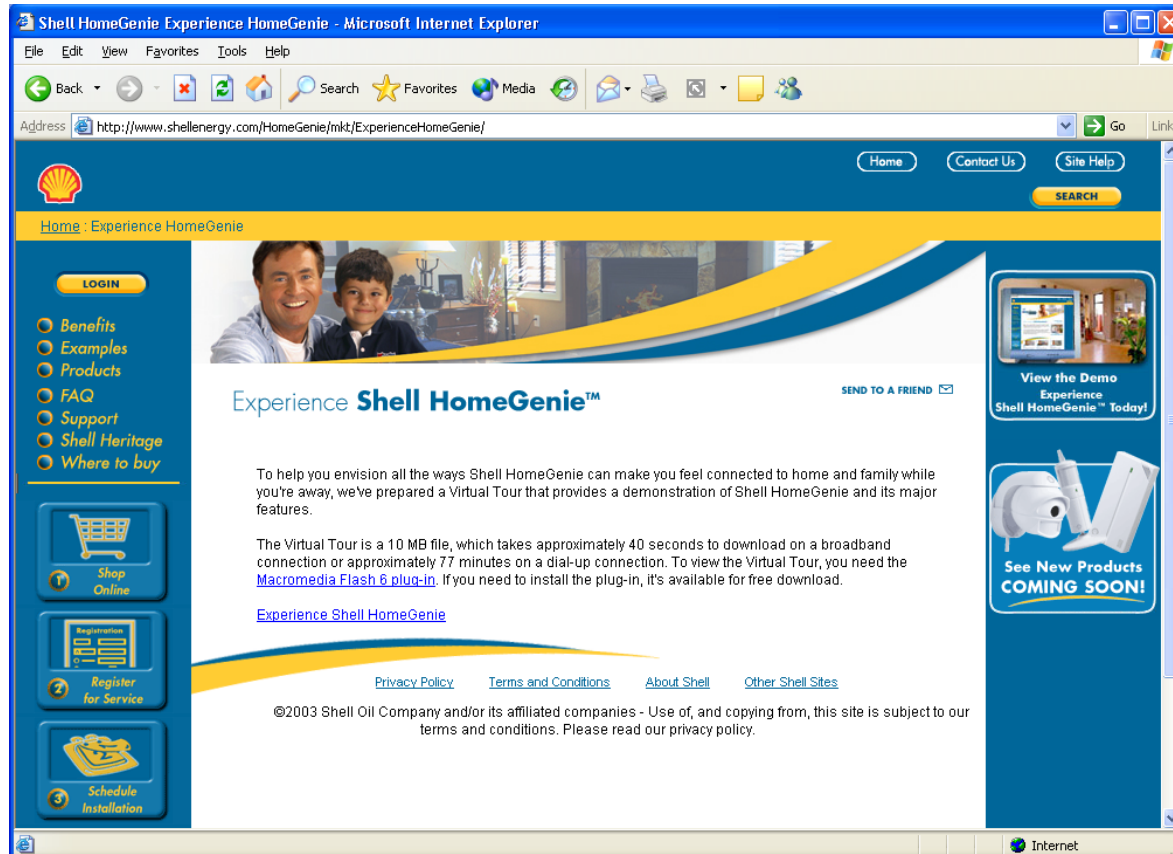

**Shell responded, but appeared to imitate
Mobil**
